

HeroHug™

Product Overview

The HeroHug™ is designed to help children learn how to purposely move and ultimately gain independence. This product seeks to limit movement of one body part in order to promote the movement of another. Once the demand and effort to control abdominal engagement and core stability is decreased, the brain registers and modifies the movement response of the rest of the body. In other words, the HeroHug™ helps with neuroplasticity, triggering natural motor patterns that appropriately program the brain's response.

The HeroHug™ is an effective and efficient product for improving motor control and helping children generate movement in different parts of the body.

Material and Dimensions

The HeroHug™ is a 6mm thick black neoprene rectangular elastic band.

It is a one size fits all up to an 86 cm circumferential torso.
